KeyMacro is a feature-rich plug-in for MS Word that increases the convenience of using the keyboard to create macros and automate some of the most tedious office tasks. Macros are created by simply selecting a sequence of keys that will be input, or an existing macro stored in KeyMacro's database. With a few keystrokes you can have your data inserted, copied, created, deleted, moved, printed, saved, and sent out automatically. There are two methods of creating macros: directly within the Macros dialog, or as a macro definition stored in the database. Macro definitions are stored within KeyMacro's database, and they must be created and saved in the application's settings file. While you are creating

---

macros, you can select how macros can be inserted into existing files, if a macro already exists, and the length of time a macro can be executed. The Macros dialog allows you to create macros, by defining keystrokes to create macros, or by choosing a macro from a saved macro definition. You can easily select multiple macros, and there is a table listing all macros, including the default macro you currently have selected. When a macro is executed it will stop automatically after the task is completed, so if you have several macros that have to be executed you can easily select the next macro in the list. KeyMacro also includes a Database, where you can store your macros. This database can be viewed with a number of viewing functions, including Alphabetical, Full view, and Column view. You can sort the macros in the database using the column headings. Within the Database you can edit or delete a macro definition, or you can create a new macro definition. You can also insert a macro definition from a macro stored in another database, or a macro saved within a macro definition. You can also set the length of time a macro can be executed, and you can set the file

---

format and save the macro in a variety of formats, including MS Word (.doc,.docx,.odt,.rtf), Rich Text Format (.rtf), HTML (.html), Open Office (.odt), PostScript (.eps), and PDF (.pdf). You can also control the action of a macro. For instance, if you select a word in a document it will automatically insert it in the database and create a macro for it. You can also set a macro to only act on a specific line of a document, 1d6a3396d6

The mechanism of the genetic and phenotypic variability of the growth characteristics of *Corynebacterium* species. *Corynebacterium* species, a group of slow-growing bacteria, form non-motile (phase I) and motile (phase II) colonies on solid media. Some of them can reach an enormous length and width (lawn colony) or migrate to other media (halo formation). The mechanism of phase variation in the *Corynebacterium* genus has not been studied in detail. We have studied the factors, which determine the growth characteristics of the main representatives of the genus. It was found that an excess of carbohydrates in the medium inhibited the

---

growth of species of the *Corynebacterium* genus. Some of them grew better on peptone than on tryptone. It was also shown that the low water activity of solid media caused the growth inhibition of the species of *Corynebacterium* genus, which had optimum growth in liquid media. The variability of the growth characteristics was not due to alterations in the cell membrane. The data of the kinetic experiments demonstrated that the "A" type strains of *C. amycolatum*, *C. amycolatum* sp. nov. and *C. urealyticum*, which lack flagella, and the "B" type strain of *C. urealyticum*, which has flagella, grow in a pattern that differs from that of motile cells of other *Corynebacterium* species. We propose to identify the "B" type strain of *C. urealyticum* as *C. crenatum*. This invention relates to a process for depositing an amorphous metallic alloy film having a superconductive property. It has been known that an amorphous metallic alloy composed mainly of elements such as Fe, Ni, Nb, Zr, Hf, Al and so on has a superconductive property. Because the superconductive property of such an amorphous metallic alloy is extremely high, its applications are

---

expected to be great. However, it has been very difficult to produce such an amorphous metallic alloy.
