1. Field of the Invention The present invention relates to a fuel injection pump for an engine. 2. Description of the Related Art Fuel injection pumps (hereinafter referred to as "fuel injection pumps") for engines of the type that use throttle bodies for fuel supply to cylinders are known. In a known type of fuel injection pump, an eccentrically rotating cam in eccentric engagement with a cam-shaft is driven by a motor to open and close a rocker arm. Then, a plunger is actuated by the rocker arm to deliver and supply fuel. Because the plunger is provided in the cylinder, the plunger is subjected to a large load. Accordingly, the plunger is formed of a metal having high strength, for example, an aluminum alloy. However, when the plunger is formed of such a material, high cost is associated with the plunger. Further, if a drive gear for the plunger is provided in an outer wall of the pump body, the outer wall of the pump body must be of a large thickness to ensure that the drive gear is accommodated inside the outer wall of the pump body. Accordingly, the pump body is large, leading to high cost. On the other hand, in another known type of fuel injection pump, a plunger is driven by a hydraulic actuator connected to the plunger. The hydraulic actuator is formed of an elastomer, and therefore, the plunger is formed of a light metal. Therefore, the plunger is formed of a material, such as aluminum or magnesium, that has low strength. When the plunger is formed of such a material, however, it is difficult to drive the plunger by the hydraulic actuator. Thus, a drive mechanism for driving the plunger in the pump body requires high-cost components and a complex structure. Japanese Unexamined Patent Publication No. 6-91217 discloses a structure that includes a rotary member made of a light metal such as magnesium, located inside a cylinder and rotatable. A compression spring accommodated in an outer portion of the rotary member applies a force to the rotary member in a direction to move the rotary member in an axial direction of the cylinder so as to align a discharge hole with a suction hole. The rotary member includes a cam section which causes a fuel pressurized in a suction chamber to be discharged from the discharge hole. A cylindrical section includes a contact surface that press

Rare inborn errors of metabolism (IEM) are a diverse group of disorders. Most of them present in early infancy with a broad spectrum of clinical manifestations. The group includes disorders with and without neonatal onset. Although clinical presentations are similar and in many cases indistinguishable, diagnosing these disorders is challenging for healthcare workers and patients. To facilitate an accurate and reliable diagnosis, considerable effort is currently put into establishing a genetic diagnosis. This review focusses on clinically heterogeneous IEM presenting with psychomotor delay. The group comprises more than 40 disorders with over 30 metabolic disorders and 11 genetically heterogeneous disorders. This article will give a detailed description of the clinical manifestations of some of the more frequent diseases with a detailed description of the current genetic approaches and therapies available. This article will also give a description of the clinical and genetic heterogeneity of disorders within this group of disorders. A table is included for a quick reference to disorders with psychomotor retardation and a list of key references.Q: How to read a bytes object in Python 3 I'm having some issues trying to make use of Python 3's binary I/O.
