How To Change The Passwords On A Router The internet is a very dangerous place if you don't know how to change the password on a router, or have accidentally logged into the device using the wrong one. Should this happen, you may want to change the router passcode to a more secure one, to make sure nobody else gains access to it. Netgear routers are notoriously simple to do, but most others will involve either connecting the router to your computer using a cable, or through the serial port. Generally, this can take just a few minutes to perform. First, make sure you have the right router. Once you do, find the correct serial port on the rear of the device, and plug it into your computer. The number of wires that go into the port will be noted on the back of the router. Netgear routers typically have a default password of either 'admin' or 'password'. Most router operating systems will not let you change the password directly, so it's important to know the right password you need to enter to make that change. It's generally best to create a unique password for each device, so that if any have been lost or stolen, you can prevent a network from being accessed by a person who doesn't

know the proper password. Use this guide to learn how to change the router passcode, and to ensure you are the only one with access to it. 3 Methods To Reset Router Password Of course, given that it is in our nature to want to access things that we shouldn't, it's easy to forget passwords, and what it is you are trying to access. Router Password Recovery is a free application that enables you to retrieve your password from a common gateway interface (CGI) router, even if you do not have the manufacturer's password. This powerful tool can help you recover your lost password when the device itself cannot be accessed. The following features are available in this program: – Recover your password using a dictionary file – View the current status of the application – Test all given passwords – Check the version of the firmware used by the device – Restore the router's default settings – Test a password given by the user (suggested) – Detect configuration errors – Connect to the router's HTTP BASIC/DIGEST authentication interface – Monitor the application's progress Router Password Recovery is designed to help users who have forgotten the router password. To start the process, simply enter the IP address of the device and the username and password that was used to log in, then press the "Start" button. The program will begin by downloading and extracting the correct router firmware version from the device's TFTP server and uploading it to the router's RAM. Next, it will unlock the router's user interface and run through the router's security settings one at a time, including restarting the DHCP service and the WWAN interface. Once the router is back online, the password will be displayed on the application's main window. For users who are not used to the command console, Router Password Recovery does provide a short tutorial that will help you understand the router login interface and how to modify it. Aside from the default settings you may need to fine-tune the router's configuration. As the application doesn't have access to the router's TFTP server, it cannot update the router itself and allow you to modify some of its settings, such as the default gateway and DNS server. However, the program will try to fetch a list of available router passwords from the manufacturer's website and offer to upload it

to the device. Besides the web browser-based authentication interface, the program also allows you to connect to the device's HTTP BASIC/DIGEST authentication port. In case the device allows you to connect to this interface, you may use it to log in as a user with no router password and get hold of the password required to log in using the browser interface.
