AutoCAD includes almost everything you need to start working, without having to buy and install additional tools. Just download the AutoCAD installer and run it to start using AutoCAD within minutes. No need to buy any additional software to open and edit files, or place, edit, and link the graphic entities and images into your drawing. These can be downloaded, or purchased separately. AutoCAD empowers the Designers to be more productive than ever before. Unmatched Productivity with Rapid Turnaround Conventional CAD packages are time consuming to learn and use. AutoCAD is the most productive, fastest, and easiest-to-learn CAD application. It offers the ease of use, versatility, and speed of drawing, layout, and editing—all at an unprecedented pace. The fastest way to learn is to simply start using it. It takes only minutes to download and get started with AutoCAD. With no training or learning required, a Designer can quickly begin working within minutes. In addition, AutoCAD's powerful database management capabilities and built-in search and replace functions can be used to edit and modify previously drawn designs, without having to re-draw the entire drawing. Part-specific extensions: Some features are available to users working with parts such as mill- and drill-parts, flanges, etc. Import and export using extensible formats: Import and export data from and to any common format in a sophisticated and robust manner. Document format standardization: Standardizes the many individual drawing formats. Digital drawings can be read and understood by the native AutoCAD application. This means that you can use the functions of a native application like the DGN driver, DGN geometry manager or DWG viewer for free and use only the programs you like. Drawing/Data management A drafting system is a tool used to create and edit a drawing. In the case of 2D drawings, this usually involves (in the case of a computer-aided drafting system) a digitizer for inputting coordinates, a drawing engine for calculating the position of the drawing objects and a display device for displaying the results. If the drawing is a 3D drawing, usually the information in the drawing is first transformed from the drawing space into a space which is more convenient for viewing. Drawing system In the CAD drawing system, "drawing" is the user's creation of a 2D drawing or a 3D model, and "data" is the format of the data used to describe the drawing. A drawing system is a collection of software products that allow a user to create and modify drawings using an input device and a software application. Organization Different types of organizations are used when making a CAD drawing. These types include (ordered by decreasing order of importance): Organization system: The organization of the model is defined by choosing among several predefined types of elements. Depending on the type of element chosen, the system will create the hierarchy for you. For example, a linear organization will assign a line and a point a direction, so that the first point in the line must be a parent of the first point in the line. Ordering system: CAD applications may offer ordering systems for complex models. A typical example is the first-in, first-out (FIFO) ordering system. In this method, the user first selects the object that must be placed last (bottom) in the model and then selects the order in which the other objects are to be placed. Animation: A model can be viewed as a single file that is broken down into many separate frames. Each frame is called a "keyframe" and the movement of the model is defined by the keyframes.
